

N32WB452 **Datasheet** 

N32WB452 series is a BLE5.0 MCU chip based on 32-bit ARM Cortex-M4F + Cortex-M0 dual-core, TX/RX power consumption is 3.5mA, transmit power is +3dBm, receiving sensitivity is -94dBm, main frequency is 144MHz, it supports floating-point operations and DSP instructions, built-in 512KB Flash, 144KB SRAM, integrated up to 512KB Flash, 144KB SRAM, 2x12bit 5Msps ADC, 2x1Msps 12bit DAC, integrated multi-channel U(S)ART, I2C, SPI, USB communication interface, 2xCAN 2.0B, 1xSDIO interface, digital camera (DVP) interface, built-in cryptographic algorithm hardware acceleration engine

## **Key features**

#### **BLE5.0**

- 2.4 GHz RF transceiver, support BLE5.0
- High receiver sensitivity (–94dBm@BLE)
- Programmable transmitter power, up to +3dBm
- Built-in Balun/Matching Network
- Receive power consumption: 3.5mA@3.0V (DCDC)
- Transmit power consumption: 3.6mA@3.0V/0 dBm (DCDC)

#### CPU core

- 32-bit ARM Cortex-M4 +FPU, one-cycle hardware multiply and divide instructions, DSP instruction and MPU support
- Built-in 8KB instruction Cache, which support Flash acceleration unit to execute program 0 wait
- Run up to 144MHz, 180DMIPS

#### **Encrypted memory**

- 512K Byte on-chip Flash + 128KB ROM, Flash supports encrypted storage, partition management and data protection functions, supports hardware ECC verification, 100,000 erasing times, 10-year data retention
- 144K Bytes of SRAM (including 16K Byte Retention RAM), Retention RAM supporting hardware parity check

#### Low power mode

- STANDBY mode: 4uA, 84 backup registers retained, all IO retained, optional RTC Run, 16KByte Retention SRAM retention, support VBAT pin independent power supply, 100uS fast wake-up
- STOP2 mode: 6uA, RTC Run, 16KByte Retention SRAM retention, CPU register retention, all IO retention, 40uS fast wake-up
- Stop0 mode: 150uA, RTC Run, all SRAM retained, all IO retained, 20uS fast wake-up.

#### Clock

- HSE: 4MHz~32MHz External high-speed crystal
- LSE: 32.768KHz External low-speed crystal
- HSI: Internal high-speed RC OSC 8MHz
- LSI: internal low-speed RC OSC 40KHz

- Built-in high speed PLL
- MCO: Support 1-way clock output, configurable SYSCLK, HSE, HSI or PLL clock output that can be divided

#### Bluetooth coprocessor clock

- 32MHz external high-speed crystal
- 32.768KHz external low-speed crystal
- Internal high-speed RC OSC 32MHz
- Internal low speed RC OSC 32KHz

#### Reset

- Support power-on/power-off/brown-out/external pin reset
- Support watchdog reset, software reset

#### Communication interface

- Up to 7x U(S)ART interfaces up to 4.5 Mbps, including 3x USART interfaces (supporting ISO7816, IrDA, LIN), and 4x UART interfaces
- 3x SPI interfaces up to 36 MHz, two of which support I2S
- 4x I2C interfaces up to 1 MHz, which can be configured in master/slave mode and support dual address response in slave mode
- 1x USB2.0 Full Speed Device interface
- 2x CAN 2.0A/B bus interfaces
- 1x SDIO interface(QFN88) supporting SD/SDIO /MMC format
- 1x DVP (Digital Video Port) interface

#### High-performance analog interface

- 2x 12-bit 5Msps high-speed ADC, 12/10/8/6bit configurable, 6bit mode up to 9Msps sampling rate, up to
   16 external single-ended input channels, supporting differential mode.
- 2x 12-bit DAC with sampling rate of 1Msps
- External input independent reference voltage source
- All analog interfaces support 1.8~3.6V full voltage operation.
- Up to 65 GPIOs supporting multiplexing function are supported, and most GPIOs support 5V tolerant
- 2x high-speed DMA controllers, each controller supports eight channels, and channel source address and destination address can be configured arbitrarily
- 1x RTC real-time clock, supporting leap year perpetual calendar, alarm events, periodic wake-up, and internal and external clock calibration.

#### • Timer counter

2x 16-bit advanced timer counters, support input capture, complementary output, orthogonal encoding input, maximum control accuracy 6.9ns. Each timer has four independent channels, three of which supports 3 channels and 6 complementary PWM output.

- 4x 16-bit general-purpose timer counters, each timer has 4 independent channels, support input capture/output comparison /PWM output.
- 2x 16-bit basic timing counters
- 1x 24bit SysTick
- 1x 7bit Window Watchdog (WWDG)
- 1x 12bit Independent Watchdog (IWDG)

#### **Programming mode**

- Support SWD/JTAG online debugging interface
- Support UART(Some versions of QFN48 package do not support), USB Bootloader

#### Safety features

- Built-in cryptographic algorithm hardware acceleration engine
- AES, DES, SHA, SM1, SM3, SM4, SM7 and MD5 algorithms are supported.
- Flash storage encryption
- Multi-user partition management (MMU)
- TRNG true random number generator
- CRC16/32
- Support write protection (WRP) and multiple read protection (RDP) levels (L0/L1/L2)
- Support secure startup, encrypted download of programs, and secure update.
- Support external clock failure detection, tamper detection.

#### 96-bit UID and 128-bit UCID

### **Working conditions**

- Voltage range: 1.8V~3.6V
- Working temperature range: -40 ℃ ~85 ℃
- ESD: ±4KV (HBM model), ±1KV(CDM model)

#### **Encapsulation**

- QFN48(6mm x 6mm)
- QFN64(8mm x 8mm )
- QFN88(10mm x 10mm)

### 1 Product introduction

N32WB452 series BLE5.0 microcontroller products use 32-bit ARM Cortex-M4 plus 32-bit ARM Cortex-M0 dual-core architecture, of which the 32-bit ARM Cortex-M0 core is dedicated to processing BLE5.0 radio frequency circuits and Bluetooth protocols, through the internal high-speed bus, configured by the ARM Cortex-M4 core. ARM Cortex-M4 core as an application processor, supports floating-point arithmetic unit (FPU) and digital signal processing (DSP) instructions, supports parallel computing instructions, the highest operating frequency is 144MHz, integrates up to 512KB encrypted storage Flash and supports multi-user partition management, maximum 144KB SRAM. Built-in one internal high-speed AHB bus, two low-speed peripheral clock bus APB and bus matrix, supports up to 65 general-purpose I/Os, provides rich high-performance analog interfaces, including two 12bit 5Msps ADCs, supports up to 16 external input channels, 2 1Msps12bit DACs, up to 18-channel capacitive touch keys, and provide a variety of digital communication interfaces, including 7 U(S)ART, 4 I2C, 3 SPI, 1 USB 2.0 device, 2 CAN 2.0 B communication interface, 1 digital video interface (DVP), 1 SDIO interface, built-in cryptographic algorithm hardware acceleration engine, supports a variety of international and national cryptographic algorithm hardware acceleration.

N32WB452 series products provide wireless connection capability compliant with BLE 5.0, work stably in the temperature range of  $-40 \, \text{C}$  to  $+85 \, \text{C}$ , supply voltage from 1.8V to 3.6V, and provide a variety of power consumption modes for users to choose from. consumption application requirements. The family is available in QFN48, QFN64 and QFN88 packages. Depending on the package type, the peripheral configuration in the device varies. These rich peripheral configurations make the N32WB452 series BLE5.0 microcontroller chips suitable for various applications such as smart door locks, smart wear, smart labels, smart home, Internet of Things and mobile Internet.

Figure 1-1 the block diagram of this series of products is given.

SPI2 and SPI3 interfaces can flexibly switch between SPI mode and I2S audio mode.

### 2 Function introduction

### 2.1 Processor core

N32WB452 series BLE5.0 MCU adopts 32-bit ARM Cortex-M4 plus 32-bit ARM Cortex-M0 dual-core architecture, of which the 32-bit ARM Cortex-M0 core is dedicated to processing BLE5.0 radio frequency circuit and Bluetooth protocol. Cortex-M4 core to configure. Among them, the ARM Cortex<sup>TM</sup>-M4F core is used as an application processor. On the basis of the Cortex<sup>TM</sup>-M3 core, the computing power is strengthened, and the floating point processing unit (FPU), DSP and parallel computing instructions are newly added, providing 1.25DMIPS/MHz. Excellent performance. At the same time, its efficient signal processing capability is combined with the low power consumption, low cost and ease of use of the Cortex-M series processors to meet application scenarios that require a mix of control and signal processing capabilities and ease of use.

ARM Cortex<sup>TM</sup>-M4F 32-bit compact instruction set processor provides excellent code efficiency, usually using the memory space of 8-bit and 16-bit devices to take advantage of the high performance of the ARM core.

*Note:*  $Cortex^{TM}$ *M4F is backward compatible with Cortex-M3 code.* 

# 2.2 Storage

N32WB452 series devices include embedded encrypted Flash memory and embedded SRAM. Figure 2-1 is a memory map.

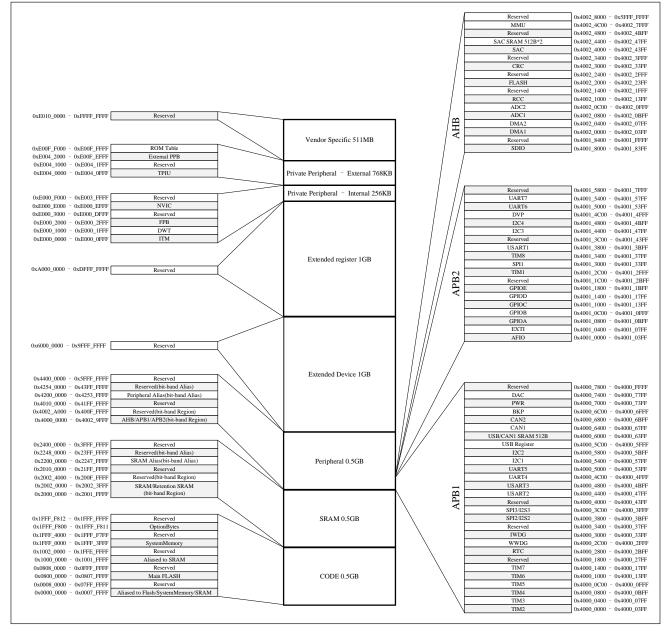

Figure 2-1 Memory map

## 2.2.1 Embedded flash memory

Integrated 512K bytes embedded encryption FLASH (FLASH), used to store programs and data, page size of 2Kbyte, supporting page erasing, word writing, word reading, half word reading, byte reading operations.

Support storage encryption protection, write automatic encryption, read automatic decryption (including program execution operation).

Support user partition management, can be divided into a maximum of two user partitions, different users cannot access each other's data (only executable code).

### 2.2.2 Embedded SRAM

Up to 144K bytes of built-in SRAM and R-SRAM are integrated on-chip, of which R-SRAM is Retention SRAM with a size of 16K bytes. R-SRAM supports Retention, which can retain data in VBAT and Standby modes (can be

configured to retain or not retain); other working modes (RUN/SLEEP/STOP0/STOP2) data can be retained by default; PWR is required to control and manage its Retention.

### 2.2.3 Nested vector interrupt controller (NVIC)

Built-in nested vector interrupt controller, capable of handling up to 86 maskable interrupt channels (not including the 16 Cortex<sup>TM</sup>-M4F interrupts) and 16 priorities.

- Tightly coupled NVIC enables low latency interrupt response processing
- Interrupt vector entry address directly into the kernel
- Tightly coupled NVIC interface
- Allows early handling of interrupts
- Handles late arriving higher-priority interrupts
- Support interrupt tail link function
- Automatically saves processor state
- Automatically resumes when the interrupt returns with no additional instruction overhead

This module provides flexible interrupt management with minimal interrupt latency.

## 2.3 External interrupt/event controller (EXTI)

The external interrupt/event controller contains 21 edge detectors for generating interrupt/event requests. Each interrupt line can be independently configured for its trigger event (rising or falling or both edges) and can be individually masked. There is a pending register that maintains the status of all interrupt requests. EXTI can detect that the pulse width is less than the clock period of the internal APB2. Up to 65 general purpose I/O ports are connected to 16 external interrupt lines.

## 2.4 Clock system

The device provides a variety of clocks for users to choose from, including internal high-speed RC oscillator HSI(8MHz), internal low-speed clock LSI(40KHz), external high-speed clock HSE(4MHz~32MHz), external low-speed clock LSE (32.768 KHz) and PLL.

During reset, the internal HSI clock is set as the default CPU clock, and then the user can choose the external HSE clock with failure monitoring function. When an external clock failure is detected, it will be isolated, the system will automatically switch to HSI, and if interrupts are enabled, the software can receive the corresponding interrupt. Also, security interrupt management of the PLL clock can be adopted when needed (such as when an indirectly used external oscillator fails).

Multiple prescaler are used to configure the AHB frequency, high-speed APB(APB2) and low-speed APB(APB1) areas. AHB has a maximum frequency of 144 MHz, APB2 has a maximum frequency of 72 MHz and APB1 has a maximum frequency of 36MHz. Refer to Figure 2-2 Clock tree diagram.

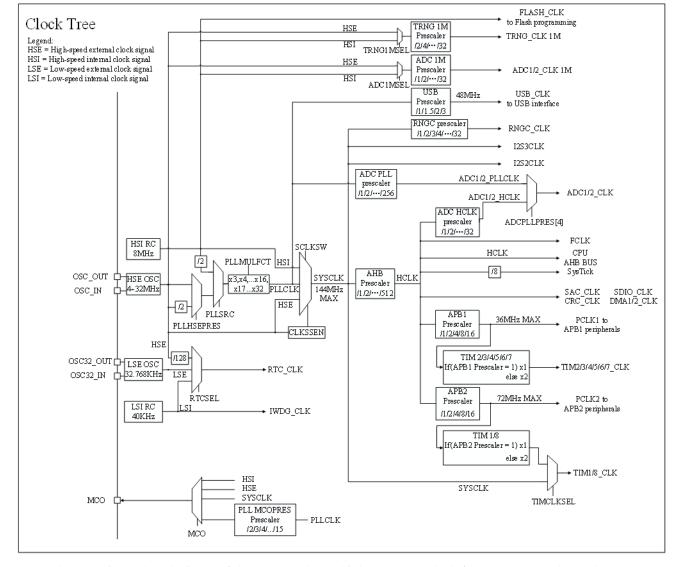

Figure 2-2 Clock tree

- 1. When HSI is used as the input of the PLL clock, the highest system clock frequency can only reach 128MHz.
- 2. When using the USB function, HSE and PLL must be used at the same time, and the frequency of the CPU must be 48MHz, 72MHz, 96MHz or 144MHz.

#### 2.5 Low-Power Bluetooth

The BLE5.0 SOC chip integrates 2.4GHZ BLE5.0 transceiver and modem, such as noise amplifier, filter, frequency synthesizer, power amplifier, etc.

Support the following characteristics:

- Receive sensitivity -94dBm, transmit power up to +3dBm, built-in Balun/matching network;
- Receive power consumption: 3.5Ma@3.0V (DCDC)
- Transmit power consumption: 3.5Ma@3.0V \0 dBm(DCDC)
- Built-in security and verification features, including AES128\CRC16;
- Supports AGC/RSSI.

Address: Nations Tower, #109 Baoshen Road, Hi-tech Park North.

The BLE core protocol stack of the BLE5.0 SOC chip runs on the internal independent Cortex-M0 core, and the application control is handled by the built-in Cortex-M4 core. For the detailed application of the N32WB452 series Bluetooth function, please refer to the "N32WB452 Series Bluetooth Components Reference Manual".

#### 2.6 Boot mode

At BOOT time, the BOOT mode after reset can be selected with the BOOT0/1 pin.

- BOOT from program FLASH Memory.
- BOOT from System Memory
- BOOT from internal SRAM

The Bootloader is stored in the system memory, and can program the flash memory through USART1 and USB interface.

## 2.7 Power supply scheme

- BLE\_DVDD =1.8~3.6V, power supply for Bluetooth control mode and internal voltage regulator.
- BLE\_VCC = 1.8~3.6V, power supply for Bluetooth RF circuit.
- $V_{DD}$ = 1.8~3.6V,  $V_{DD}$  pin supplies power to the I/O pin and internal voltage regulator.
- $V_{SSA}$ ,  $V_{DDA}$ = 1.8~3.6V, provides power supply for ADC, DAC reset block, RC oscillator, and PLL.  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$  respectively.
- $V_{BAT}$ = 1.8~3.6V: When  $V_{DD}$  is turned off, it supplies power to RTC, external 32KHz oscillator and backup register.

For more information on how to connect the power supply pins, see Figure 4-3 Power supply scheme o

#### **2.8 Reset**

The power-on reset (POR) and power-down reset (PDR) circuits are integrated inside. This part of the circuit is always in working state to ensure that the system works when the power supply exceeds 1.8V; when  $V_{DD}$  is lower than the set threshold ( $V_{POR/PDR}$ ), place the device in reset without using an external reset circuit.

# 2.9 Programmable voltage detector

The device has a built-in programmable voltage detector (PVD), which monitors the power supply of  $V_{DD}/V_{DDA}$  and compares it with the threshold  $V_{PVD}$ . When  $V_{DD}$  is lower or higher than the threshold  $V_{PVD}$ , an interrupt will be generated. The interrupt handler can send a warning message, and the PVD function needs to be started through the program. See Table 4-10 for values of  $V_{POR/PDR}$  and  $V_{PVD}$ .

# 2.10 Voltage regulator

Voltage regulator operating modes as follow:

- MCU run in RUN, SLEEP modes: Main voltage regulator(MR) operates in normal mode
- MCU run in STOP0 modes: Main voltage regulator(MR) operates in normal mode or low-power mode;
- MCU run in STOP2, STANDBY mode: Main voltage regulator(MR) shut down and backup domain voltage regulator(BKR) turn on.

After the chip is reset, the main voltage regulator(MR) operates in normal mode by default.

### 2.11 Low power mode

N32WB452 series products support five low power consumption modes.

#### SLEEP mode

In SLEEP mode, only the CPU stops and all peripherals are active and can wake up the CPU when an interrupt/event occurs.

#### ■ STOP0 mode

STOP0 mode is based on the Cortex-M4F deep sleep mode, which can achieve lower power consumption without losing the contents of the SRAM and registers. In STOP0 mode, most of the clocks of the main power domain are turned off, such as PLL, HSI, HSE, and the main voltage regulator is put into normal mode or low power mode.

Wake-up: The chip can be woken up from STOP0 mode by any signal configured as EXTI. The EXTI signal can be 16 external EXTI signals (I/O related), PVD output, RTC wake-up, RTC alarm clock, touch wake-up, wake-up signal from USB.

#### ■ STOP2 mode

STOP2 mode is based on Cortex-M4F deep sleep mode, all core digital logic areas are powered off. The main voltage regulator is turned off and the HSE/HSI/PLL is turned off. CPU registers are maintained, LSE/LSI can be configured to work, all GPIOs are maintained, and peripheral I/O multiplexing functions are not maintained. 16K bytes R-SRAM is kept, other SRAM and register data will be lost. 84 bytes of backup register retention.

Wake-up: The chip can be woken up from STOP2 mode by any signal configured as EXTI. The EXTI signal can be 16 external EXTI signals (I/O related), PVD output, RTC periodic wake-up, RTC alarm clock, RTC invasion, NRST reset, IWDG reset.

#### ■ STANDBY mode

In STANDBY mode, the current consumption is low. Internal voltage regulator is turned off, PLL, HSI RC oscillator and HSE crystal oscillator are also turned off; after entering STANDBY mode, the content of the register will be lost, but the content of the backup register is still retained, R-SRAM can be maintained, Standby circuit still works.

An external reset signal on NRST, IWDG reset, a rising edge on the WKUP pin, RTC wake-up, or RTC's alarm can wake the microcontroller from STANDBY mode.

#### ■ VBAT mode

At any time, whenever VDD is powered down, it will automatically enter VBAT mode. In VBAT mode, except NRST, PA0-WKUP, PC13\_TAMPER, PC14, PC15, most I/O pins are in high impedance state.

Note: RTC, IWDG and corresponding clock will not be stopped when entering STANDBY mode.

# 2.12 Direct memory access (DMA)

The device integrates 2 flexible general-purpose DMA controllers, each DMA controller supports 8 channels, and can manage memory-to-memory, peripheral-to-memory, and memory-to-peripheral data transfers; 2 DMA controllers support ring buffer management, which avoids the interruption of the controller transfer when it reaches the end of the buffer.

Each channel has dedicated hardware DMA request logic, and each channel can be triggered by software at the same time. The length of the transfer, the source address and the destination address of the transfer can be individually set by software for each channel.

DMA can be used for major peripherals: SPI, I<sup>2</sup>C, USART, advanced/generic/basic timers TIMx, DAC, I<sup>2</sup>S, SDIO, ADC, DVP.

### 2.13 Real time clock (RTC)

RTC is a set of continuously running counters with built-in calendar clock module, which can provide perpetual calendar function, as well as alarm clock interrupt and periodic interrupt (minimum 2 clock cycles) functions. RTC can be powered by  $V_{DD}$  or  $V_{BAT}$  pin. When  $V_{DD}$  is valid, select  $V_{DD}$  to supply power. Otherwise, it is powered by VBAT pin, which is automatically selected and switched by hardware. The RTC will not be reset by system or power reset sources, nor will it be reset when waking up from STANDBY mode.

The driving clock of RTC can be selected as 32.768KHz external crystal oscillator, internal low-power 40KHz RC oscillator, or any clock source divided by 128 for high-speed external clock. For application scenarios that require very high timing accuracy, it is recommended to use an external 32.768KHz clock as the clock source. At the same time, to compensate for the clock deviation of natural crystals, the RTC clock can be calibrated by outputting a 512Hz signal. The RTC has a 22-bit prescaler for the time base clock, by default when the clock is 32.768kHz it will produce a 1 second long time base. In addition, RTC can be used to trigger wake-up from low-power states.

## 2.14 Timer and watchdog

Up to 2 advanced control timers, 4 general-purpose timers and 2 basic timers, as well as 2 watchdog timers and 1 system tick timer.

The following Table compares the functions of advanced control timer, general-purpose timer and basic timer:

| Timer                        | Counter<br>resolution | Counter type         | Prescaler factor                      | Generate<br>DMA<br>request | Capture/compare channels | Complementary output |
|------------------------------|-----------------------|----------------------|---------------------------------------|----------------------------|--------------------------|----------------------|
| TIM1<br>TIM8                 | 16 bits               | Up, Down,<br>Up/Down | Any integer<br>between 1 and<br>65536 | Y                          | 4                        | Y                    |
| TIM2<br>TIM3<br>TIM4<br>TIM5 | 16 bits               | Up, Down,<br>Up/Down | Any integer<br>between 1 and<br>65536 | Y                          | 4                        | N                    |
| TIM6<br>TIM7                 | 16 bits               | Up                   | Any integer<br>between 1 and<br>65536 | Y                          | 0                        | N                    |

**Table 2-1 Timer function comparison** 

### 2.14.1Basic timer (TIM6 and TIM7)

Basic timers TIM6 and TIM7 each contain a 16-bit auto-reload counter. These two timers are independent of each other and do not share any resources. The basic timer can provide a time reference for general purpose timers, and in particular can provide a clock for a digital-to-analog converter (DAC). The basic timer is directly connected to the DAC inside the chip and drives the DAC directly through the trigger output.

The main functions of the basic timer are as follows:

- 16-bit auto-reload accumulating counter
- 16-bit programmable prescaler (the frequency division factor can be configured as any value between 1 and 65536)
- Trigger DAC synchronization circuit
- Generate interrupt/DMA request on update event

## 2.14.2 General-purpose timer (TIMx)

4 general timers (TIM2, TIM3, TIM4 and TIM5) are mainly used in the following occasions: counting input signals, measuring the pulse width of input signals and generating output waveforms.

The main functions of the universal timer include:

- 16-bit auto-reload counters. (It can realize up-counting, down-counting, up/down counting)
- 16-bit programmable prescaler. (The frequency division factor can be configured with any value between 1 and 65536)
- TIM2, TIM3, TIM4 and TIM5 up to 4 channels.
- Channel's working modes: PWM output, ouput compare, one-pulse mode output, input capture.
- The events that generate the interrupt/DMA are as follows:
  - ◆ Update event
  - ◆ Trigger event
  - ◆ Input capture
  - Output compare
- Timer can be controlled by external signal
- Timers can be linked together internally for timer synchronization or chaining
- Incremental (quadrature) encoder interface: used for tracking motion and resolving rotation direction and position;
- Hall sensor interface: used to do three-phase motor control.

### 2.14.3 Advanced control timer (TIM1 and TIM8)

The advanced control timers (TIM1 and TIM8) is mainly used in the following occasions: counting the input signal, measuring the pulse width of the input signal and generating the output waveform, etc.

Advanced timers have complementary output function with dead-time insertion and break function. Suitable for motor control.

The main functions of the advanced timer include:

- 16-bit auto-reload counters. (It can realize up-counting, down-counting, up/down counting).
- 16-bit programmable prescaler. (The frequency division factor can be configured with any value between 1 and 65536)
- Programmable Repetition Counter
- TIM1 up to 6 channels, TIM8 up to 6 channels
- 4 capture/compare channels, the working modes are PWM output, ouput compare, one-pulse mode output, input capture.
- The events that generate the interrupt/DMA are as follows:
  - Update event
  - ◆ Trigger event
  - ♦ Input capture
  - ♦ Output compare
  - ♦ Break input
- Complementary outputs with adjustable dead-time.
  - ◆ For TIM1/8, channel 1,2,3 support this feature.
- Timer can be controlled by external signal

- Multiple timers are connected together internally to achieve timer synchronization or chaining
- Incremental (quadrature) encoder interface: used for tracking motion and resolving rotation direction and position;
- Hall sensor interface: used to do three-phase motor control.

### 2.14.4SysTick timer (Systick)

This timer is dedicated to the real-time operating system and can also be used as a standard down counter.

It has the following characteristics:

- 24-bit down counter
- Automatic reload function
- A maskable system interrupt is generated when the counter is 0
- Programmable clock source

### 2.14.5 Watchdog (WDG)

Support for two watchdog independent watchdog (IWDG) and window watchdog (WWDG). Two watchdogs provide increased security, time accuracy, and flexibility in use.

#### **Independent Watchdog (IWDG)**

The independent watchdog is based on a 12-bit decrepit counter and an 3-bit pre-scaler. It is driven by a separate low-speed RC oscillator that remains active even if the master clock fails and operates in STOP, STOP2and STANDBY modes. Once activated, if the dog is not fed (clears the watchdog counter) within the set time, the IWDG generates a reset when the counter counts to 0x000. It can be used to reset the entire system in the event of an application problem, or as a free timer to provide time-out management for applications. The option byte can be configured to start the watchdog software or hardware. Reset and low power wake up are available.

#### Window Watchdog (WWDG)

A window watchdog is usually used to detect software failures caused by an application deviating from the normal running sequence due to external interference or unforeseen logical conditions. Unless the decline counter value is flushed before the T6 bit becomes zero, the watchdog circuit generates an MCU reset when the preset time period is reached. If the 7-bit decrement counter value (in the control register) is flushed before the decrement counter reaches the window register value, then an MCU reset will also occur. This indicates that the decrement counter needs to be refreshed in a finite time window.

#### Main features:

- WWDG is driven by the clock obtained by dividing APB1 clock
- Programmable free-running decrement counter
- Conditional reset:
  - ◆ When the decrement counter is less than 0x40, a reset is generated (if the watchdog is started)
  - ◆ A reset occurs when the decrement counter is reloaded outside the window (if the watchdog is started)
  - ♦ If the watchdog is enabled and interrupts are allowed, an early wake up interrupt (EWINT) occurs when the decrement counter equals 0x40, which can be used to reload the counter to avoid WWDG reset

### 2.15 I<sup>2</sup>C bus interface

The device integrates up to 4 independent I2C bus interfaces, which provide multi-host function and control all I2C bus-specific timing, protocol, arbitration and timeout. Supports multiple communication rate modes (up to 1MHz), supports DMA operations and is compatible with SMBus 2.0. The I2C module provides multiple functions, including

CRC generation and verification, System Management Bus(SMBus), and Power Management Bus(PMBus).

The main functions of the I2C interface are described as follows:

- Multi-master function: this module can be used as master device or slave device;
- I2C master device function:
  - ◆ Generate a clock;
  - ◆ Generate start and stop signals;
- I2C slave device function:
  - ◆ Programmable address detection;
  - ◆ I2C interface supports 7-bit or 10-bit addressing and dual-slave address response capability in 7-bit slave mode
  - ♦ Stop bit detection;
- Generate and detect 7-bit / 10-bit addresses and broadcast calls;
- Support different communication speeds;
  - ◆ Standard speed (up to 100 kHz);
  - ◆ Fast (up to 400 kHz);
  - lack Fast + (up to 1MHz);
- Status flags:
  - Transmitter/receiver mode flag;
  - Byte transfer complete flag;
  - ◆ I2C bus busy flag;
- Error flags:
  - ◆ Arbitration is missing in Master mode
  - ◆ Acknowledge (ACK) error after address/data transfer;
  - Error start or stop condition detected
  - Overrun or underrun when clock extending is disable;
- Two interrupt vectors:
  - ◆ 1 interrupt for address/data communication success;
  - ◆ 1 interrupt for an error;
- Optional extend clock function
- DMA of single-byte buffers;
- Generation or verification of configurable PEC(Packet error detection)
- In transmit mode, the PEC value can be transmitted as the last byte
- PEC error check for the last received byte
- SMBus 2.0 compatible
  - ◆ Timeout delay for 25ms clock low
  - ♦ 10 ms accumulates low clock extension time of master device
  - ◆ 25 ms accumulates low clock extension time of slave device

- PEC generation/verification of hardware with ACK control
- Support address resolution protocol (ARP)
- PMBus compatible

#### 2.16 Universal synchronous/asynchronous transceiver (USART)

N32WB452 series products integrate up to 7 serial transceiver interfaces, including 3 universal synchronous/ asynchronous transceivers (USART1/USART2/USART3) and 4 universal asynchronous transceivers (UART4/ UART5/UART6/UART7). These 7 interfaces provide asynchronous communication, support for IrDA SIR ENDEC transmission codec, multi-processor communication mode, single-line half-duplex communication mode, and LIN master/slave function.

The communication rate of USART1/UART6/UART7 interface can reach 4.5Mbit/sec, and the communication rate of other interfaces can reach 2.25Mbit/sec.

The USART1 USART2 and USART3 interfaces have hardware CTS and RTS signal management, ISO7816compatible smart card mode, and SPI-like communication mode, all of which can use DMA operations.

The main features of USART are as follows:

- Full duplex, asynchronous communication
- NRZ standard format
- Fractional baud rate generator system, baud rate programmable, used for sending and receiving, up to 4.5 Mbits/s
- Programmable data word length (8 or 9 bits)
- Configurable stop bit, supporting 1 or 2 stop bits
- LIN master's ability to send synchronous interrupters and LIN slave's ability to detect interrupters. When USART hardware is configured as LIN, it generates 13 bit interrupters and detects 10/11 bit interrupters
- Output sending clock for synchronous transmission
- IRDA SIR encoder decoder, supports 3/16 bit duration in normal mode
- Smart card simulation function
  - The smart card interface supports the asynchronous smart card protocol defined in ISO7816-3
  - 0.5 and 1.5 stop bits for smart cards
- Single-wire half duplex communication
- Configurable multi-buffer communication using DMA, receiving/sending bytes in SRAM using centralized DMA buffer
- Independent transmitter and receiver enable bits
- Detection flag
  - Receive buffer is full
  - Send buffer empty
  - End of transmission flag
- Parity control
  - Send parity bit
  - Verify the received data
- Four error detection flags

- Overflow error
- Noise error
- Frame error
- Parity error
- 10 USART interrupt sources with flags
  - ◆ CTS change
  - ◆ LIN disconnect detection
  - ◆ Send data register is empty
  - Send complete
  - Received data register is full
  - Bus was detected to be idle
  - Overflow error
  - ◆ Frame error
  - ◆ Noise error
  - ◆ Parity the error
- Multi-processor communication, if the address does not match, then enter the silent mode;
- Wake up from silent mode (via idle bus detection or address flag detection)
- Mode configuration:

| USART modes                     | USART1 | USART2 | USART3 | UART4 | UART5 | UART6 | UART7 |
|---------------------------------|--------|--------|--------|-------|-------|-------|-------|
| Asynchronous mode               | Y      | Y      | Y      | Y     | Y     | Y     | Y     |
| Hardware flow control           | Y      | Y      | Y      | N     | N     | N     | N     |
| Multi-cache communication (DMA) | Y      | Y      | Y      | Y     | Y     | Y     | Y     |
| Multiprocessor communication    | Y      | Y      | Y      | Y     | Y     | Y     | Y     |
| Synchronize                     | Y      | Y      | Y      | N     | N     | N     | N     |

# 2.17 Serial peripheral interface (SPI)

The device integrates 3 SPI interfaces, reusable as an I<sup>2</sup>S interface, SPI shares resources with I<sup>2</sup>S.

SPI allow the chip to communicate with peripheral devices in a half/full duplex, synchronous, serial manner. This interface can be configured in master mode and provides a communication clock (SCK) for external slave devices. Interfaces can also work in a multi-master configuration. It can be used for a variety of purposes, including two-line simplex synchronous transmission using a two-way data line, and reliable communication using CRC checks.

The main functions of SPI interfaces are as follows:

- 3-wire full-duplex synchronous transmission
- Two-wire simplex synchronous transmission with or without a third bidirectional data line

- 8 or 16 bit transmission frame format selection
- Master or slave operations
- Support multi-master mode
- 8 master mode baud rate predivision frequency coefficient (maximum f<sub>PCLK</sub>/2)
- Slave mode frequency (maximum  $f_{PCLK}/2$ )
- Fast communication between master mode and slave mode
- NSS can be managed by software or hardware in both master and slave modes: dynamic change of master/slave modes
- Programmable clock polarity and phase
- Programmable data order, MSB before or LSB before
- Dedicated send and receive flags that trigger interrupts
- SPI bus busy flag;
- Hardware CRC for reliable communication;
  - ♦ In send mode, the CRC value can be sent as the last byte;
  - ◆ In full-duplex mode, CRC is automatically performed on the last byte received.
- Master mode failures, overloads, and CRC error flags that trigger interrupts
- Single-byte send and receive buffer with DMA capability: generates send and receive requests
- Maximum speed: SPI1 interface 36Mbps, SPI2/SPI3 interface 18Mbps

## 2.18 Serial audio interface (I<sup>2</sup>S)

I<sup>2</sup>S is a 3-pin synchronous serial interface communication protocol. The device integrates 2 standard I2S interfaces (multiplexed with SPI) and can operate in master or slave mode. I<sup>2</sup>S can be configured for 16-bit, 24-bit or 32-bit transmission, or as input or output channels, supporting audio sampling frequencies from 8KHz to 96KHz. It supports four audio standards, including Philips I<sup>2</sup>S, MSB and LSB alignment, and PCM.

It can work in master and slave mode in half duplex communication. When it acts as a master device, it provides clock signals to external slave devices through an interface.

The main functions of I<sup>2</sup>S interface are as follows;

- Simplex communication (send or receive only)
- Master or slave operations
- 8-bit linear programmable prescaler for accurate audio sampling frequencies (8 KHZ to 96KHz)
- The data format can be 16, 24, or 32 bits
- Audio channel fixed packet frame is 16 bit (16 bit data frame) or 32 bit (16, 24 or 32 bit data frame)
- Programmable clock polarity (steady state)
- The overflows flag bit in slave sending mode and the overflows flag bit in master/slave receiving mode
- 16-bit data registers are used for sending and receiving, with one register at each end of the channel
- Supported I<sup>2</sup>S protocols:
  - ◆ I<sup>2</sup>S Philips standard
  - ◆ MSB alignment standard (left aligned)

- LSB alignment standard (right aligned)
- ◆ PCM standard (16-bit channel frame with long or short frame synchronization or 16-bit data frame extension to 32-bit channel frame)
- The data direction is always MSB first
- Both send and receive have DMA capability
- The master clock can be output to external audio devices at a fixed rate of 256xFs(Fs is the audio sampling frequency)

## 2.19 Secure digital input output interface (SDIO)

Secure Digital Input and Output (Secure Digital Input and Output), referred to as SDIO interface, SDIO host interface provides an operation interface between AHB peripheral bus and Multimedia Card (MMC), SD memory card, SDIO card devices.

SDIO host functions are as follows:

- Support "MultiMediaCard System Specification Version 4.2", support 1-bit (default), 4-bit and 8-bit data bus, forward compatible with earlier MMC protocol
- Support "SD Memory Card Specifications Version 2.0"
- Support "SD I/O Card Specification Version 2.0", support 1-bit (default) and 4-bit data format
- SDIO clock rate up to 48MHz
- SDIO does not support SPI communication

### 2.20 Controller Area Network (CAN)

The device integrates 2 channel CAN bus interface compatible with 2.0A and 2.0B (active) specifications, with bit rates up to 1Mbps. It can receive and send standard frames with 11-bit identifiers, as well as extended frames with 29-bit identifiers.

#### Main features:

- Support CAN protocol 2.0A and 2.0B active mode
- Baud rate up to 1Mbps
- Supports time-triggered communication
- Send
  - 3 sending mailboxes
  - ◆ The priority of sent packets can be configured by software
  - Records the timestamp of the time when the SOF was sent
- Receive
  - ◆ Level 3 depth of 2 receiving FIFO
  - Variable filter group:
  - ◆ There are 14 filter groups
  - ◆ Identifier list
  - ◆ The FIFO overflow processing mode is configurable
  - Record the time stamp of the receipt of the SOF

24 / 91

- Time-triggered communication mode
  - ◆ Disable automatic retransmission mode
  - ◆ 16-bit free run timer
  - ◆ Timestamp can be sent in the last 2 bytes of data
- Management
  - Interrupt masking
  - ◆ The mailbox occupies a separate address space to improve software efficiency

### 2.21 Universal serial bus (USB)

N32WB452 series products embed a full-speed USB-compatible device controller and follow the full-speed USB device (12Mbit/s) standard. The endpoints can be configured by software and have standby/wake-up functions. The USB-specific 48MHz clock is directly generated by the internal main PLL (to ensure communication stability, the clock source must be an HSE external high-speed crystal).

The main features of the USB device controller are as follows:

- Comply with the technical specifications of USB2.0 full-speed devices
- Configurable from 1 to 8 USB endpoints
- CRC (Cyclic Redundancy Check) generation/checking, non-return-to-zero (NRZI) reverse encoding/decoding and bit stuffing
- Double buffer mechanism supporting bulk/sync endpoints
- Support USB suspend/resume operation
- Frame lock clock pulse generation
- USB DP signal line supports internal 1.5K pull-up resistor (firmware control), with an accuracy of ±5%

# 2.22 General purpose input and output interface (GPIO)

Supports up to 65 GPIOs, which are divided into 5 groups (GPIOA/GPIOB/GPIOC/GPIOD/GPIOE), of which PA/PB/PC has 16 ports per group, PD group has 8 ports in total, and PE group has 9 ports in total. Each GPIO pin can be configured by software as output (push-pull or open-drain), input (with or without pull-up or pull-down), or multiplexed peripheral function port, most GPIO pins are connected with digital or analog Multiplexed peripherals are shared, and some I/O pins are also multiplexed with clock pins; except for ports with analog input functions, all GPIO pins have high current passing capability.

The main features of GPIO are described as follows:

- Each bit of the GPIO port can be configured separately by the software into multiple modes:
  - Input floating
  - ◆ Input pull up (weak pull up)
  - ◆ Input pull down (weak pull down)
  - Analog input
  - Open drain output
  - Push-pull output
  - Push-pull multiplexing function

- ◆ Open drain multiplexing function
- General I/O (GPIO)
  - During and just after reset, the alternate functions are not enabled, except for BOOT0 and BOOT1(BOOT0 and BOOT1 are input pull-down) and NRST pin, the I/O port is configured to analog input mode.
  - ◆ During and just after reset, the alternate function is not turned on, the I/O port is configured as analog input mode, and after reset, the JTAG pin is placed in input pull-up or pull-down mode:
    - ✓ JTDI in pull-up mode;
    - ✓ JTCK in drop down mode;
    - ✓ JTMS in pull-up mode;
    - ✓ NJTRST is placed in pull-up mode
  - ◆ When configured as output, values written to the output data registers are output to the appropriate I/O pins. Can be output in push pull mode or open drain mode
- Separate bit setting or bit clearing functions
- External interrupt/wake up: All ports have external interrupt capability. In order to use external interrupts, ports must be configured in input mode
- Alternate function :(port bit configuration register must be programmed before using default alternate function)
- GPIO lock mechanism, which freezes I/O configurations. When a LOCK is performed on a port bit, the configuration of the port bit cannot be changed until the next reset

# 2.23 Analog/digital converter (ADC)

Up to 2 successive comparison ADC with 12-bit 5Msps sampling rate, support single-ended input and differential input, an measure 16 external and 3 internal signal sources, of which ADC1 supports 9 external channels, ADC2 supports 12 external channels, and some pins share two different ADC channels.

The main features of ADC are described as follows:

- Support 12/10/8/6-bit resolution configurable
  - ◆ The highest sampling rate at 12bit resolution is 5.14MSPS
  - ◆ The maximum sampling rate at 10bit resolution is 6MSPS
  - ◆ The maximum sampling rate at 8bit resolution is 7.2MSPS
  - ◆ The maximum sampling rate at 6bit resolution is 9MSPS
- ADC clock source is divided into working clock source, sampling clock source and timing clock source
  - ◆ AHB\_CLK can be configured as the working clock source, up to 144MHz
  - ◆ PLL can be configured as a sampling clock source, up to 72MHZ, support 1,2,4,6,8,10,12,16,32, 64,128,256 frequency division
  - ◆ AHB\_CLK can be configured as the sampling clock source, up to 72MHz, and supports frequency 1,2,4,6,8,10,12,16,32

- ◆ The timing clock is used for internal timing functions and the frequency must be configured to 1MHz
- Supports timer trigger ADC sampling
- Interrupts when conversion ends, injection conversion ends, and analog watchdog events occur
- Single and continuous conversion modes
- Automatic scan mode from channel 0 to channel N
- Support for self-calibration
- Data alignment with embedded data consistency
- Sampling intervals can be programmed separately by channel
- Both regular conversions and injection conversions have external triggering options
- Continuous mode
- Dual ADC mode, ADC1 and ADC2 combination
- ADC power supply requirements: 1.8V to 3.6V
- ADC input range:  $VREF \leq VIN \leq VREF +$
- ADC can use DMA operations, and DMA requests are generated during regular channel conversion.
- Analog watchdog function can monitor one, multiple, or all selected channels with great precision. When the monitored signal exceeds the preset threshold, an interruption will occur.

## 2.24 Digital-to-analog converter (DAC)

Support 2 digital-to-analog converters (DAC). DAC is a digital-to-analog converter with 12-bit digital input and voltage output. The DAC module has 2 output channels, each channel has a separate converter, and the 2 DAC can be used at the same time without affecting each other. The DAC can input the reference voltage VREF+ through the pin to obtain more accurate conversion results.

This dual digital interface supports the following functions:

- 2 DAC converters: each with an output channel
- Configurable 8-bit or 12-bit output
- Configurable left and right data alignment in 12-bit mode
- Update function
- Generate noise wave
- Generate triangular wave
- Dual DAC channel independent or synchronous conversion
- Every channel can use DMA function.
- External trigger for conversion
- Input voltage VREF+

# 2.25 Temperature sensor (TS)

The temperature sensor produces a voltage that varies linearly with temperature in range of  $1.8V < V_{DDA} < 3.6V$ . The temperature sensor is internally connected to the input channel of ADC1\_IN16 for converting the output of the sensor

to a digital value.

## 2.26 Digital Video Interface (DVP)

DVP is a flexible and powerful CMOS optical sensor interface, which can easily realize the customer's image acquisition requirements, and the entire acquisition process does not require CPU intervention.

The functional characteristics of the DVP interface module are as follows:

- Pure hardware acquisition method
- Support clock output (typical value 24MHz) to provide clock to external CMOS chip
- 8 x 32bit FIFO, FIFO can transfer 4 bytes at a time
- Support DMA, no need for CPU intervention in the whole process of image acquisition
- The size of the acquired image must be an integer multiple of 4
- Supports the inversion of the captured image

## 2.27 Cyclic redundancy check calculation unit (CRC)

Integrated CRC32 and CRC16 functions, the cyclic redundancy check (CRC) calculation unit is based on a fixed generation polynomial to obtain any CRC calculation results. In many applications, CRC-based techniques are used to verify data transfer or storage consistency. Within the scope of the EN/IEC 60335-1 standard, which provides a means of detecting flash memory errors, CRC cells can be used to calculate signatures of software in real time and compare them with signatures generated when linking and generating the software.

The CRC has the following features:

- CRC16: supports polynomials  $X^{16} + X^{15} + X^2 + X^0$
- $\blacksquare \quad \text{CRC32: supports polynomials } X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1 + X^{10} +$
- CRC16 calculation time: 1 AHB clock cycles (HCLK)
- CRC32 calculation time: 1 AHB clock cycles (HCLK)
- The initial value for cyclic redundancy computing is configurable
- Support DMA mode

# 2.28 Security Acceleration Engine (SAC)

Embedded algorithm hardware acceleration engine supports a variety of international algorithms and national cryptographic symmetric cryptographic algorithms and hash cryptographic algorithm acceleration, which can greatly improve the encryption and decryption speed compared with pure software algorithms.

The supported algorithms of hardware are as follows:

- Support DES symmetric algorithm
  - ◆ DES and 3DES encryption and decryption operations are supported
  - ◆ TDES supports 2KEY and 3KEY modes.
  - ◆ Support CBC and ECB modes
- AES symmetric algorithm is supported
  - ◆ 128bit/192bit/ 256bit key length is supported
  - ◆ Support CBC, ECB and CTR modes

- Support SHA hash algorithm
  - ◆ Support SHA1/SHA244/SHA256
- Support MD5 summarization algorithm
- Support symmetric national secret SM1, SM4, SM7 algorithm and SM3 hash algorithm.

### 2.29 Unique device serial number (UID)

N32WB452 series products have two built-in unique device serial numbers of different lengths, which are 96-bit Unique Device ID (UID) and 128-bit Unique Customer ID (UCID). These two device serial numbers are stored in the system configuration block of flash memory. The information they contain is written at the time of delivery and is guaranteed to be unique to any of the N32WB452 series microcontrollers under any circumstances and can be read by user applications or external devices through the CPU or JTAG/SWD interface and cannot be modified.

The 96-bit UID is usually used as a serial number or password. When writing flash memory, this unique identifier is combined with software encryption and decryption algorithm to further improve the security of code in flash memory.

UCID is 128-bit, which complies with the definition of national technology chip serial number. It contains the information related to chip production and version.

## 2.30 Serial single-wire JTAG debug port (SWJ-DP)

Embedded ARM SWJ-DP interface, which is a combination of JTAG and serial single-line debugging interface, can achieve serial single-line debugging interface or JTAG interface connection. The JTMS and JTCK signals of JTAG share pins with SWDIO and SWCLK respectively, and a special signal sequence on the JTMS pin is used to switch between JTAG-DP and SW-DP.

- 1. I = input, O = output, S = power supply, HiZ = high impedance.
- 2. FT: tolerate 5V; TTa: tolerates 3.3V and supports analog peripherals; TC: ordinary 3.3V I/O
- 3. Some functions are only supported in some models of chips.
- 4. Pin PC13, PC14 and PC15 are powered by the power switch, which can only absorb limited current (3mA). Therefore, when these three pins are used as output pins, they have the following limitations: only one pin can be used as output at the same time; when they are used as output pins, they can only work in 2MHz mode, and the maximum driving load is 30pF, and they cannot be used as current sources (such as driving LEDs).
- 5. When the backup area is powered on for the first time, these pins are in the main function state. After that, even if they are reset, the state of these pins is controlled by the backup area registers (these registers will not be reset by the main reset system). For specific information on how to control these IO ports, please refer to the battery backup area of N32WB452 user's reference manual and relevant chapters of BKP register.
- 6. Some multiplexing functions can be configured to other pins by software (if the corresponding package model has this pin). For details, please refer to the multiplexing function I/O chapter and debugging setting chapter of N32WB452 user reference manual.
- 7. Pin 5 and pin 6 of LQFP64 package are configured as OSC\_IN and OSC\_OUT function pins by default after the chip is reset. Software can reset these two pins to PD0 and PD1 functions. When used as PD0 and PD1, these two pins can only be used as ordinary IO functions. However, for LQFP80/100/128 package, because PD0 and PD1 are inherent functional pins, there is no need to re-image by software. For more details, please refer to the reuse function I/O chapter and debugging settings chapter of N32WB452 user reference manual.
- 8. Fail-safe means that when the chip has no power input, the input high level is added to IO, and there is no phenomenon that the input high level is poured into the chip, which leads to a certain voltage on the power supply and consumes current.

Note: ADC12\_INx appears in the pin name label in the Table, indicating that this pin can be ADC1\_INx or ADC2\_INx. For example, ADC12\_IN9 indicates that this pin can be configured as ADC1\_IN9 or ADC2\_IN9.

TIM2\_CH1\_ETR in the multiplexing function corresponding to pin PA0 in the Table indicates that the function can be configured as TIM2\_T11 or TIM2\_ETR. Similarly, the name of the remapping multiplexing function corresponding to PA15, TIM2\_CH1\_ETR, has the same meaning.

For the port of FT in the Table, it is necessary to ensure that the difference between IO voltage and power supply voltage is less than 3.6V.

# 3.3 Bluetooth application reference circuit

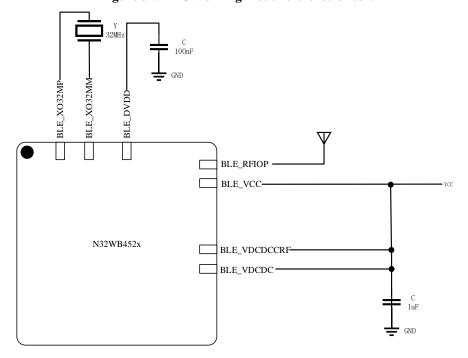

The following figure lists the main peripheral devices and related parameters required when the Bluetooth part of the N32WB452 series works in DCDC mode and LDO mode. BLE\_RFIOP is connected to an external antenna, BLE\_VCC is connected to an external power supply, BLE\_VDCDC is connected to an external inductor and capacitor, BLE\_DVDD is connected to an external capacitor, and an external 32MHz crystal is required. For applications that do not require high timing accuracy, the internal 32kHz RC Oscillator can be used to save BOM costs; On-chip DCDC, direct external power supply.

100nF - GND BLE\_X032MM BLE\_XO32MP BLE\_DVDD BLE\_RFIOP BLE\_VCC 4. 7uF N32WB452X BLE\_VDCDCCRF BLE\_VDCDC -BLE\_SWITCH -

# 4 Electrical specification

#### 4.1 Parameter condition

All voltages are based on VSS unless otherwise specified.

#### 4.1.1 Minimum and maximum values

Unless otherwise specified, all minimums and maximums will be guaranteed under the worst ambient temperature, supply voltage and clock frequency conditions by performing tests on 100% of the product on the production line at ambient temperatures  $T_A$ =25  $^{\circ}$ C and TA=TAmax (TAmax matches the selected temperature range).

Note at the bottom of each form that data obtained through characterization results, design simulation and/or process characteristics will not be tested on the production; Base on comprehensive evaluation, the minimum and maximum values are obtained by taking the average of the samples tested and adding or subtracting three times the standard distribution (mean  $\pm 3\Sigma$ ).

## 4.1.2 Typical numerical value

Unless otherwise specified, typical data are based on  $T_A$ = 25 C and  $V_{DD}$ =3.3V. These data is untested and used only as a design guide for the user.

### 4.1.3 Typical curve

Unless otherwise specified, these typical curves are untested and used only as a design guide for the user.

### 4.1.4 Loading capacitor

The load conditions for measuring pin parameters are shown in Figure 4-1.

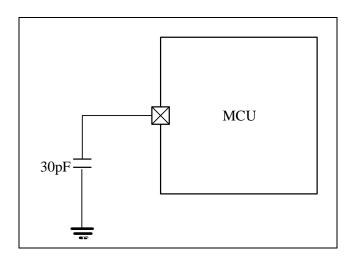

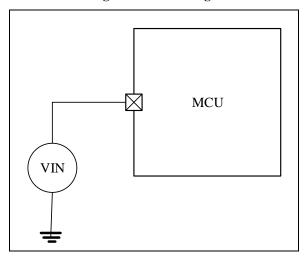

Figure 4-1 Pin load conditions

# 4.1.5 Pin input voltage

The measurement of the input voltage on pin is shown in Figure 4-2.

Figure 4-2 Pin voltage

### 4.1.7 Current consumption measurement

IDD VDD

Figure 4-4 Current consumption measurement scheme

# 4.2 Absolute maximum rating

The load applied to the device may permanently damage the device if it exceeds the values given in the Absolute maximum rating list (Table 4-1. Table 4-2. Table 4-3). The maximum load that can be sustained is only given here, and it does not mean that the functional operation of the device under such conditions is correct. The reliability of the device will be affected when the device works for a long time under the maximum condition.

| I <sub>INJ(PIN)</sub> (2)(3) | Injection current of NRST pin                           | -5/0 |
| IINJ(PIN)(2)(3)              | Injection current of other pins <sup>(4)</sup>          | +/-5 |

- All the power supply (V<sub>DD</sub>, V<sub>DDA</sub>) and ground (V<sub>SS</sub>, V<sub>SSA</sub>)pins of must always be connected to the power supply system within the
  external allowable range.
- 2. When V<sub>IN</sub>>V<sub>DD</sub>, there is a forward injection current; when V<sub>IN</sub><V<sub>SS</sub>, there is a reverse injection current. I<sub>INJ(PIN)</sub> should not exceed its maximum value. Voltage characteristics refer to Table 4-1.
- 3. Reverse injection current can interfere with the analog performance of the device. See section 4.4.21.
- 4. When the maximum current occurs, the maximum allowable voltage drop of V<sub>DD</sub> is 0.1V<sub>DD</sub>.

**Table 4-3 Temperature characteristic** 

| Symbol    | Description                  | Value     | Unit          |
|-----------|------------------------------|-----------|---------------|
| $T_{STG}$ | Storage temperature range    | -40 ~ 105 | $\mathcal C$  |
| $T_J$     | Maximum junction temperature | 105       | ${\mathbb C}$ |

Guaranteed by design, not tested in production.

# 4.4.4 Embedded reference voltage

The parameters given in the following table are based on the ambient temperature and VDD supply voltage listed in Table 4-8.

| Symbol                 | Parameter  | Condition                     | Min   | Тур  | Max               | Unit |
|------------------------|--|-------------------------------|-------|------|-------------------|------|
| V <sub>REFINT</sub>    | Built-in reference voltage                                       | -40 ℃< T <sub>A</sub> < +85 ℃ | 1.164 | 1.20 | 1.24              | V    |
| $T_{S\_vrefint}^{(1)}$ | Sampling time of ADC when reading out internal reference voltage | -                             | -     | 5.1  | 10 <sup>(2)</sup> | μs   |

- 1. The shortest sampling time is obtained through multiple cycles in the application.
- 2. Based on comprehensive evaluation, not tested in production.

### 4.4.5 Power supply current characteristics

Current consumption is a combination of several parameters and factors, including operating voltage, ambient temperature, load of I/O pins, software configuration of the product, operating frequency, I/O pin flip rate, program location in memory, and code executed.

The measurement method of current consumption is described in Figure 4-4.

All of the current consumption measurements given in this section are while executing a reduced set of code.

### 4.4.5.1 Maximum current consumption

The microcontroller is under the following conditions:

- All I/O pins are in input mode and are connected to a static level -- VDD or VSS (no load).
- All peripherals are disabled except otherwise noted.
- The access time of the flash memory is adjusted to the fastest operating frequency (0 waiting periods from 0 to 32MHz, 1 waiting period from 32 to 64MHz, 2 waiting periods from 64MHz to 96MHz, 3 waiting periods from 96MHz to 128MHz, 4 waiting periods from 128MHz to 144MHz).
- Instruction prefetch is enabled (note: this parameter must be set before setting the clock and bus divider).
- When the peripheral is enable:  $f_{PCLK1} = f_{HCLK}/4$ ,  $f_{PCLK2} = f_{HCLK}/2$ .
- $V_{DD}$ =3.63V, ambient temperature equal to 85 °C.

The parameters given in Table 4-12 and Table 4-13 are based on the test at ambient temperature and  $V_{DD}$  supply voltage listed in Table 4-8.

- 1. Guaranteed by comprehensive evaluation results, test in production with V<sub>DD</sub>max and peripherals enabled with f<sub>HCLK</sub>max.
- 2. The external clock is 8MHz, PLL is enabled when f<sub>HCLK</sub>>8MHz.
- 3. Bluetooth is turned off.

### 4.4.5.2 Typical current consumption

MCU is under the following conditions:

- All I/O pins are in input mode and are connected to a static level -- VDD or VSS (no load).
- All peripherals are disabled unless otherwise noted.
- The access time of the flash memory is adjusted to the fastest operating frequency (0 waiting periods from 0 to 32MHz, 1 waiting period from 32 to 64MHz, 2 waiting periods from 64MHz to 96MHz, 3 waiting periods from 96MHz to 128MHz, 4 waiting periods from 128MHz to 144MHz).
- Ambient temperature and V<sub>DD</sub> supply voltage conditions are listed in Table 4-8.
- Instruction prefetch is enabled (note: this parameter must be set before setting the clock and bus divider). When the peripheral is turned on:  $f_{PCLK1} = f_{HCLK}/4$ ,  $f_{PCLK2} = f_{HCLK}/2$ ,  $f_{ADCCLK} = f_{PCLK2}/4$ .

Table 4-14 Typical current consumption in running mode, data processing code runs from internal Flash

- 1. Typical values are measured at  $T_A=25$  °C and  $V_{DD}=3.3v$ .
- 2. An additional 0.8mA current consumption is added to the ADC for each analog section. In the application environment, this part of the current will only increase when the ADC is turned on (setting the ON bit of the ADC\_CTRL2 register).
- 3. The external clock is 8MHz, and the PLL is enabled when  $f_{HCLK}$ >8MHz.
- 4. Bluetooth is turned off.

- 1. Typical values are measured at  $T_A=25$  °C and  $V_{DD}=3.3v$ .
- 2. When ADC is on, 0.8mA(1MSPS) additional current consumption is added. In the application environment, this part of the current is increased only when the ADC is turned ON (set ADC\_CTRL2.ON bit).
- 3. The external clock is 8MHz, PLL is enabled when f<sub>HCLK</sub>>8MHz.
- Bluetooth is turned off.

# 4.4.5.3 Low power mode current consumption

MCU is under the following conditions:

- All I/O pins are in input mode and are connected to a static level -- VDD or VSS (no load).
- All peripherals are disabled unless otherwise noted.

Table 4-16 Typical and maximum current consumption in shutdown mode and standby mode

Figure 4-5 AC timing diagram of external high-speed clock source

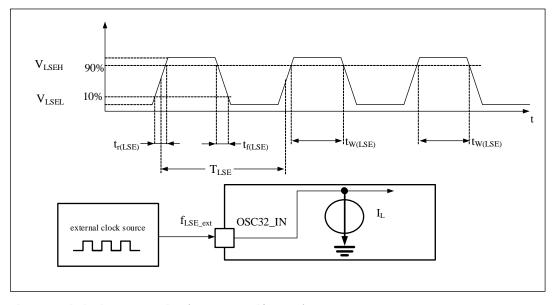

Figure 4-6 Ac timing diagram of external low-speed clock source

#### High-speed external clock generated using a crystal/ceramic resonator

High speed external clocks (HSE) can be generated using an oscillator consisting of a 4~32MHz crystal/ceramic resonator. The information presented in this section is based on a comprehensive feature evaluation using typical external components listed in the table below. In applications, the resonator and load capacitance must be as close to the oscillator pins as possible to reduce output distortion and stabilization time at startup. For detailed crystal resonator parameters (frequency, package, accuracy, etc.), please consult the appropriate manufacturer. (The crystal resonator mentioned here is usually referred to as passive crystal oscillator).

| Symbol                   | Parameter                   | Condition   | Min | Тур | Max | Unit |
|--------------------------|-----------------------------|---|-----|-----|-----|------|

| $g_{\rm m}$              | Oscillator transconductance | Startup   | -   | 10  | -   | mA/V |
| t <sub>SU(HSE)</sub> (3) | Start time(8M crystal)      | V <sub>DD</sub> is stabilized                                       | -   | 3   | -   | ms   |

Table 4-19 HSE 4~32MHz oscillator characteristics<sup>(1)(2)</sup>

- 1. The characteristic parameters of the resonator are given by the crystal/ceramic resonator manufacturer.
- 2. According to comprehensive assessment, it is not tested in production.
- 3. For CL1 and CL2, it is recommended to use high-quality ceramic capacitors between 5pF and 25pF designed for high frequency applications (typical value), and select a crystal or resonator that meets the requirements. Usually CL1 and CL2 have the same parameters. Crystal manufacturers usually give parameters for the load capacitance as a serial combination of CL1 and CL2. When choosing CL1 and CL2, the capacitive reactance of the PCB and N32WB452 pins should be taken into account (the capacitance between the pins and the PCB board can be roughly estimated as 10pF).

Address: Nations Tower, #109 Baoshen Road, Hi-tech Park North.

Figure 4-7 Typical application using 8MHz crystal

1. The REXT value depends on the properties of the crystal.

#### Low-speed external clock generated by a crystal/ceramic resonator

The low speed external clock (LSE) can be generated using an oscillator consisting of a 32.768KHz crystal/ceramic resonator. The information presented in this section is based on a comprehensive feature evaluation using typical external components listed in table below. In applications, the resonator and load capacitance must be as close to the oscillator pins as possible to reduce output distortion and stabilization time at startup. For detailed crystal resonator parameters (frequency, package, accuracy, etc.), please consult the appropriate manufacturer. (The crystal resonator mentioned here is usually referred to as passive crystal oscillator)

Note: For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high quality ceramic dielectric containers. Usually  $C_{L1}$  and  $C_{L2}$  have the same parameters. Crystal manufacturers usually give parameters for load capacitance as serial combinations of  $C_{L1}$  and  $C_{L2}$ .

Load capacitance  $C_L$  is calculated by the following formula:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ , where  $C_{stray}$  is the capacitance of the pin and the PCB or PCB-related capacitance.

For example, if a resonator with a load capacitance of C<sub>L</sub>=6pF is selected and C<sub>stray</sub>=2pF, then C<sub>L1</sub>=C<sub>L2</sub>=8pF.

| Symbol           | Parameter                   | Condition   | Min | Тур | Max | Unit |

| t <sub>SU(LSI)</sub> (2) | LSI oscillator start-up time     | -   | -   | 40  | 80  | μs   |
| I <sub>DD(LSI)</sub> (2) | LSI oscillator power consumption | -   | -   | 0.1 | -   | μΑ   |

<sup>1.</sup>  $V_{DD}=3.3V$ ,  $T_A=-40 \sim 85$  °C, unless otherwise specified.

### 4.4.8 Wake up time from low power mode

The wake-up time listed in Table 4-23 is measured during the wake-up phase of an 8MHz HSI RC oscillator. The clock source used when waking up depends on the current operating mode:

- STOP0/STOP2/STANDBY mode: Clock source is RC oscillator.
- SLEEP mode: Clock source is the clock used when entering SLEEP mode.

All times were measured using ambient temperature and supply voltage in accordance with Table 4-8.

Table 4-23 Wake-up time in low power mode

| Symbol                              | Parameter   | Тур | Unit |
|-------------------------------------|---|-----|------|
| t <sub>WUSLEEP</sub> (1)            | Wake up from sleep mode   | 480 | ns   |
|                                     | Wake up from shutdown mode 0 (voltage regulator is in running mode)   | 20  |      |
| t <sub>WUSTOP0</sub> <sup>(1)</sup> | Wake up from shutdown mode 0 (voltage regulator is in low power mode) | 22  |      |
| twustop2 (1)                        | Wake up from shutdown mode 2  | 40  | μs   |
| twustdby <sup>(1)</sup>             | Wake up from standby mode   | 100 |      |

<sup>1.</sup> The wake-up time is measured from the start of the wake-up event to the first instruction read by the user program.

#### 4.4.9 PLL characteristic

The parameters listed in Table 4-24 are measured when the ambient temperature and power supply voltage refer to the conditions in Table 4-8.

Table 4-24 PLL characteristic

| Symbol              | Parameter                                       |     | Unit |         |       |
|---------------------|---|-----|------|---------|-------|
| Symbol              | rarameter                                       | Min | Тур  | Max (1) | Ullit |
| f                   | PLL input clock <sup>(2)</sup>                  | 4   | 8.0  | 32      | MHz   |
| t <sub>PLL_IN</sub> | PLL input clock duty cycle                      | 40  | -    | 60      | %     |

<sup>1.</sup> Based on comprehensive evaluation, not tested in production.

#### Static latch-up

In order to evaluate the latch-up performance, two complementary static latching tests need to be performed on 6 samples:

- Supply voltage exceeding limit for each power pin.
- Current is injected into each input, output, and configurable I/O pin.

This test conforms to JEDEC78E integrated circuit latch-up standard.

Table 4-28 Electrical sensitivity

- for VIL:
  - If VDD is between [1.8V and 2.28V]; Uses TTL features but includes CMOS.
  - If VDD is between [2.28V and 3.60V]; Uses CMOS feature but includes TTL.

#### **Output drive current**

GPIO (general purpose input/output port) can absorb or output up to +/-12mA current. In user applications, the number of I/O pins must ensure that the driving current does not exceed the absolute maximum rating given in Section 4.2:

- The sum of the current drawn from  $V_{DD}$  by all I/O ports, plus the maximum operating current drawn by the MCU on  $V_{DD}$ , cannot exceed the absolute maximum rating of IVDD (Table 4-2).
- The sum of the current drawn by all I/O ports and drawn from  $V_{SS}$ , plus the maximum operating current drawn by the MCU on  $V_{SS}$ , cannot exceed the absolute maximum ratings,  $I_{VSS}$  (Table 4-2).

#### **Output voltage**

Unless otherwise specified, Based on comprehensive evaluation, not tested in production. The parameters listed in Table 4-31were measured using ambient temperature and VDD supply voltage in accordance with Table 4-8. All I/O ports are CMOS and TTL compatible.

I/O port speed can be configured by DS\_CFGy and PMODEy[1:0]. See N32WB452 reference manual for the description of GPIO port configuration register.

The maximum frequency is Figure 4-9 Define.

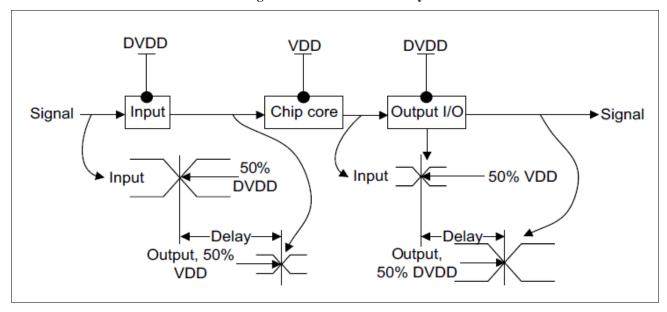

EXTERNAL OUTPUT on CL

Maximum frequency is achieved if  $(t_r + t_f) <= (2/3)T$  and if the duty cycle is (45-55%) when loaded by CL specified in the table "I/O AC characteristics"

#### 4.4.15I2C interface characteristics

Unless otherwise specified, the parameters listed in Table 4-38 were measured using ambient temperature,  $f_{PCLK1}$  frequency, and  $V_{DD}$  supply voltage in accordance with Table 4-8.

The I2C interface of the N32WB452 product conforms to the standard I2C communication protocol, but has the following limitations: SDA and SCL are not "true" open leak pins, and when configured for open leak output, the PMOS tube between the pin and VDD is closed, but still exists.

I2C interface features are listed in Table 4-38. See Section 4.4.12 for details about the features of the input/output multiplexing function pins (SDA and SCL).

- 1. Based on comprehensive evaluation, not tested in production.
- 2. To achieve the maximum frequency of standard mode  $I^2C$ ,  $f_{PCLK1}$  must be greater than 2MHz. To achieve the maximum frequency of fast mode I<sup>2</sup>C, f<sub>PCLK1</sub> must be greater than 4MHz.

- 1. The measuring points are set at CMOS level:  $0.3V_{DD}$  and  $0.7V_{DD}$ .
- 2. The pull-up resistor depends on the I2C interface speed.
- 3. The resistance value depends on the actual electrical characteristics. The signal line can be directly connected without serial resistance.

### 4.4.16SPI/I<sup>2</sup>S interface characteristics

Unless otherwise specified, the SPI parameters listed in Table 4-39 / Table 4-40 and the  $I^2S$  parameters listed in Table 4-41 are measured using ambient temperature,  $f_{PCLKx}$  frequency, and  $V_{DD}$  supply voltage in accordance with Table 4-8.

See section 4.4.12 for details on the characteristics of the I/O reuse pins (NSS, SCLK, MOSI, MISO for SPI, WS, CLK, SD for I<sup>2</sup>S).

Table 4-39 SPI1 feature<sup>(1)</sup>

- 1. Based on comprehensive evaluation, not tested in production.
- 2. The minimum value represents the minimum time to drive the output, and the maximum value represents the maximum time to get the data correctly.
- The minimum value represents the minimum time for turning off the output and the maximum value represents the maximum time for placing the data line in a high resistance state.

#### 4.4.17SD/SDIO host interface characteristics

Unless otherwise specified, the parameters listed in Table 4-42 are measured using ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage in accordance with the conditions in Table 4-8.

For details on the characteristics of the I/O alternate function pins (D[7:0], CMD, CK), see Section 4.4.12.

| $V_{\mathrm{OL}}$         | Static output low level              | $1.5k\Omega$ R <sub>L</sub> connected to $3.6V^{(5)}$           | -                  | 0.3                | V    |
| $V_{\mathrm{OH}}$         | Static output high level             | 15kΩ R <sub>L</sub> connected to V <sub>SS</sub> <sup>(5)</sup> | 2.8                | 3.6                | v    |

- 1. All voltage measurements are based on the ground wire of the device.
- 2. In order to be compatible with the USB 2.0 full-speed electrical specification, the USB operating voltage is 3.0~3.6V.
- 3. The correct USB function of N32WB452 series products can be guaranteed at 2.7V instead of degraded electrical characteristics in the voltage range of 2.7~3.0V.
- 4. Based on comprehensive evaluation, not tested in production.
- 5. R<sub>L</sub> is the load connected to the USB drive.

#### 4.4.20 Characteristics of Controller Area Network (CAN) Interface

See Section 4.4.12 for details on the features of the input/output multiplexing function pins (CAN\_TX and CAN\_RX).

### 4.4.21 Electrical parameters of 12-bit analog-to-digital converter (ADC)

Unless otherwise specified, the parameters in Table 4-47 are measured using ambient temperature,  $f_{HCLK}$  frequency, and  $V_{DDA}$  supply voltage in accordance with the conditions in Table 4-8.

Note: It is recommended to perform a calibration at each power up.

Nanshan District, Shenzhen, 518057, P.R.China

- 1. Only fast channels are supported.
- 2. Based on comprehensive evaluation, not tested in production.
- 3. According to different packages,  $V_{\text{REF+}}$  can be internally connected to  $V_{\text{IN}}$  and  $V_{\text{REF-}}$  can be internally connected to  $V_{\text{IN}}$ .

#### Formula 1: maximum R<sub>AIN</sub> formula

$$R_{AIN} < \frac{T_{\text{S}}}{f_{\text{ADC}} \times C_{\text{ADC}} \times \ln{(2^{N+2})}} - R_{\text{ADC}}$$

The above formula (Formula 1) is used to determine the maximum external impedance so that the error can be less than 1/4 LSB. Where N=12 (representing 12-bit resolution).

Table 4-48 ADC sampling time<sup>(1)(2)</sup>

| Input        | Resolution | Rin(kΩ) | Minimum sampling time (ns) | Input         | Resolution | $Rin(k\Omega)$ | Minimum sampling time (ns) |

| EL                | Integral linear error     | 25 °C The measurement is performed after ADC calibration. $V_{REF+} = V_{DDA}$ | ±0.8 | -   | LSB  |

- 1. The DC accuracy values of the ADC are measured after internal calibration.
- 2. ADC Accuracy vs. Reverse Injection Current: Injecting reverse current on any standard analog input pin needs to be avoided, as this will significantly degrade the accuracy of an ongoing conversion on another analog input pin. It is recommended to add a Schottky diode (between the pin and ground) to standard analog pins where reverse injection current may occur.
- 3. How to inject current in the forward direction, as long as it is within the range of I<sub>INJ(PIN)</sub> and ΣI<sub>INJ(PIN)</sub> given in Section 4.4.12, it will not affect the ADC accuracy.
- 4. Guaranteed by comprehensive evaluation, not tested in production.

Figure 4-23 Typical connection diagram using ADC

1. On the numerical values of RAIN, RADC and CADC, see Table 4-47.

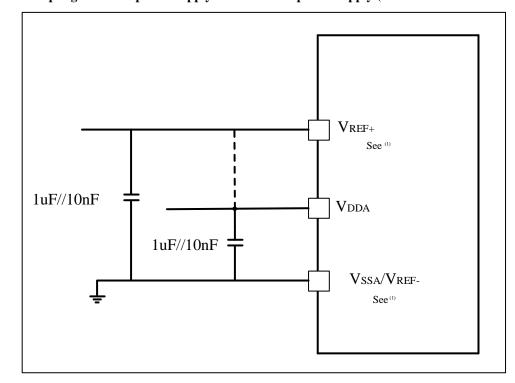

Note: Cparasitic represents parasitic capacitance on PCB (related to soldering and PCB layout quality) and pads(approximately 7pF). A larger Cparasitic value would reduce the accuracy of conversion, and the solution was to reduce fADC.

#### PCB design suggestions

Depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$ , the decoupling of the power supply must be connected as shown in Figure 4-24 or Figure 4-25. The 10nF capacitors in the picture must be ceramic capacitors (good quality), and they should be as close to the MCU chip as possible.

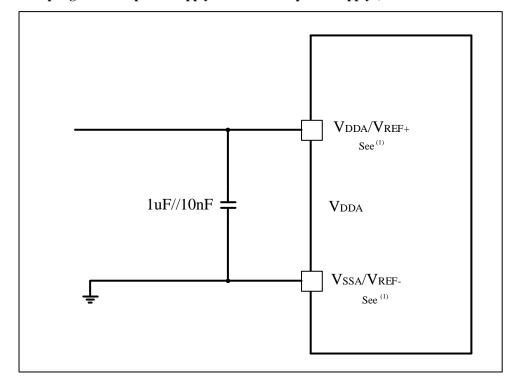

Figure 4-24 Decoupling circuit of power supply and reference power supply (V<sub>REF+</sub> is not connected to V<sub>DDA</sub>)

 $V_{\text{REF+}}$  and  $V_{\text{REF-}}$  inputs only products with more than 100 feet.

Figure 4-25 Decoupling circuit of power supply and reference power supply ( $V_{REF^+}$  is connected with  $V_{DDA}$ )

 $V_{\text{REF+}}$  and  $V_{\text{REF-}}$  inputs only products with more than 100 pins.

### 4.4.22 Electrical parameters of 12-bit digital-to-analog converter (DAC)

Unless otherwise specified, the parameters in Table 4-50 are measured using ambient temperature,  $f_{HCLK}$  frequency, and  $V_{\text{DDA}}$  supply voltage in accordance with the conditions in Table 4-8.

#### **Table 4-50 DAC characteristics**

### 4.4.23 Temperature sensor (TS) characteristics

Unless otherwise specified, the parameters in Table 4-51 are measured using ambient temperature,  $f_{HCLK}$  frequency, and  $V_{DDA}$  supply voltage in accordance with the conditions in Table 4-8.

**Table 4-51 Temperature sensor characteristics** 

| Symbol                   | Parameter   | Min | Тур  | Max       | Unit          |
|--------------------------|---|-----|------|-----------|---------------|
| $T_L^{(1)}$              | Linearity of V <sub>SENSE</sub> with respect to temperature | -   | ±1   | <u>+4</u> | $\mathcal{C}$ |
| Avg_Slope <sup>(1)</sup> | Average slope   | -   | -4.1 | -         | mV/℃          |
| $V_{30}^{(1)}$           | Voltage at 30 ℃   | -   | 1.32 | -         | V             |
| tstart(1)                | setting time  | -   | 10   | -         | μs            |
| $T_{S_{-temp}}^{(2)(3)}$ | When reading temperature, ADC sampling time                 | 8.2 | -    | -         | μs            |

- 1. Guaranteed by comprehensive evaluation, not tested in production.
- 2. Based on comprehensive evaluation, not tested in production.
- 3. The shortest sampling time of can be determined by the application through multiple cycles.

### **4.4.24SMT Soldering Temperature Characteristics**

Please refer to Figure 4-26 for N32WB452 series SMT soldering temperature characteristic curve. For detailed SMT soldering process, please refer to the industry standard: IPC/JEDEC J-STD-020E.

## **5.4 Marking Information**

Figure 5-4 Marking information

# **6 Version History**

| Date       | Version | Modify   |
|------------|---------|--|
| 2020.2.20  | V1.0    | Initial version  |
| 2020.05.17 | V1.01   | 1. Updated QFN88 package size information  |
| 2020.03.17 | V 1.U1  | 2. Added section 4.4.24 SMT Soldering Temperature Characteristics  |
|            |         | Delete Flash page programming function description   |
| 2020.04.20 | ¥74 4   | 2. Update the number of channels supported by ADC1, ADC2 and the maximum   |
| 2020.06.28 | V1.1    | number of external channels supported  |
|            |         | 3. Update the electrical characteristics chapter   |
|            |         | 1. Modify the DVP FIFO size in Section 2.29: 32x 32bit to 8 x 32bit  |
|            |         | 2. Revised 4.1.6 power supply scheme   |
|            |         | 3. Modified the parameters of absolute maximum ratings   |
|            |         | 4. Modified 4.4.2 Operating conditions at power-up and power-down VDD rise   |
|            |         | rate minimum value   |
|            |         | 5. Modified 4.4.3 Embedded Reset and Power Control Module Features   |
|            |         | 6. Modified 4.3.5 Supply Current Characteristics fHCLK frequency and   |
|            |         | fPCLK1/fPCLK2  |
| 2020.9.16  | V1.2    | 7. Modified the LSI parameters of 4.3.7 Internal clock source characteristics  |
|            |         | 8. Modified 4.4.9 FLASH storage characteristic parameters  |
|            |         | 9. Modified 4.4.12 I/O port characteristics  |
|            |         | 10. Modified 4.4.13 NRST pin characteristics   |
|            |         | 11. Modified 4.4.14 TIM feature tCOUNTER parameter   |
|            |         | 12. Revised 4.4.15 SPI/I2S Interface Characteristics Figure 4-14   |
|            |         | 13. Modified 4.4.19 12-bit analog-to-digital converter (ADC) electrical parameters   |
|            |         | 14. Modified 4.4.20 DAC electrical parameters  |
|            |         | 15. Modified 4.4.22 Temperature sensor characteristics   |
|            |         | Modify the schematic diagram of 3.1 package  |
|            |         | 2. Modify the memory map in Figure 2-1   |
| 2020.11.27 | V1.2.1  | 3. Modify the supplementary description of the pin definitions in Table 3-1  |
|            |         | 4. Modify the reference circuit diagram of DCDC working mode in Figure 3-4   |
|            |         | Modify the parameters related to embedded reset and power control module   |
|            |         | characteristics  |
|            |         | 2. Modify the parameters related to the high-speed external user clock   |
| 2021.08.02 | V.1.2.2 | characteristics  |
|            |         | 3. Modify the parameters related to the low-speed external user clock feature  |
|            |         | 4. Modify the parameters related to flash memory characteristics   |
|            |         | The state of the s |

|            |         | 5. Modify the conditions related to the absolute maximum value of ESD             |
|------------|---------|---|
|            |         | 6. Modify the parameters related to I/O static characteristics                    |
|            |         | 7. Modify the output voltage characteristic conditions, refer to the new drive    |
|            |         | capability table  |
|            |         | 8. Modify the parameters related to the input and output AC characteristics       |
|            |         | 9. Modify the parameters related to the input NRST pin characteristics            |
|            |         | 10. Modify the parameters related to the input I2C interface characteristics      |
|            |         | 11. Modify the parameters related to the input SPI1 characteristics               |
|            |         | 12. Modify the parameters related to the input SPI2 characteristics               |
|            |         | 13. Modify the parameters related to the input I2S characteristics                |
|            |         | 14. Modify the input I2S master mode timing diagram identification error          |
|            |         | 15. Modify the parameters related to the input SD/MMC interface characteristics   |
|            |         | 16. Modify the parameters related to the dynamic characteristics of the input DVP |
|            |         | signal  |
|            |         | 17. Modify the input ADC characteristic conditions and related parameters         |
|            |         | 18. Modify the parameters related to the input DAC characteristics                |
|            |         | 19. Modify the parameters related to the input temperature sensor characteristics |
|            |         | Modify the parameters related to the power supply current characteristics         |
|            |         | 2. Added remarks for IO static features   |
|            |         | 3. Added remarks for output voltage characteristics                               |
| 2021.09.17 | V.1.2.2 | 4. Remarks for increased electrical sensitivity                                   |
|            |         | 5. Modify the general working conditions related conditions                       |
|            |         | 6. Added silkscreen instructions  |
| 2021.10.22 | V2.0.0  | 1. Version change   |
|            |         | Modify the description of I/O port characteristic conditions                      |
|            |         | 2. Pin multiplexing defines the ADC pin to indicate whether it is a slow channel  |
|            |         | or a fast channel   |
|            |         | 3. Added note on HSI oscillator characteristics                                   |
|            |         | 4. Modify the power-on time parameters of ADC characteristics                     |
|            |         | 5. Updated QFN48 package diagram  |
| 2021.05.23 | V2.1    | 6. ADC characteristics indicate that the maximum sampling rate is 5MHz, only      |
|            |         | fast channel support  |
|            |         | 7. LSE oscillator feature to remove ESR CL limit                                  |
|            |         | 8. Update typical application using 32.768kH crystal                              |
|            |         | 9. Update the input and output AC characteristics table                           |
|            |         | 10. Updated recommended NRST pin protection diagram                               |
| L          | l       | ı   |

- 11. Fixed TA conditions for static latch-up LU
- 12. Add Timer electrical characteristics section parameter table
- 13. Fixed SPI input clock duty cycle parameters
- Modify of resource configuration description (only 88PIN package supports DVP)
- 15. Modify the description of embedded R-SRAM hold
- 16. CRC calculation time changed to 1 HCLK
- 17. Added STOP2 wake source: RTC intrusion, NRST reset, IWDG reset wake
- 18. Modified the RTC real-time clock output frequency from 512Hz to 256Hz
- 19. Modify the figure 4-3/4-4/4-5/4-6/4-17/4-23/4-24/4-25
- 20. Modify Table 4-11 Built-in reference voltage
- 21. Add Table 4-17/4-18 Bypass mode description
- 22. Modify Table 4-21 Typical IDD values
- 23. Modified Table 4-21 Welding deviation notes
- 24. Modify the description in Table 4-22
- 25. Modify Table 4-26 data retention period
- 26. Modify static locking test criteria
- 27. Modified Table 4-29 description and added the description of VIH/VIL
- 28. Modify the description in Table 4-33
- 29. Modify the description in Table 4-47
- 30. Add table 4-48 ADC sampling time
- 31. Modify the description in Table 4-19/4-21/4-22/4-24/4-50/4-51
- 32. Modify the number of EXTI edge detectors to 21
- 33. Modify the IWDG prescaler to 3-bit
- 34. Modified reset description in Key features
- 35. Modified STOP0 mode description of the working mode of the main voltage regulator
- 36. Modify the I/O structure description in Table 3-1

#### 7 Notice

This document is the exclusive property of Nations Technologies Inc. (Hereinafter referred to as NATIONS). This document, and the product of NATIONS described herein (Hereinafter referred to as the Product) are owned by NATIONS under the laws and treaties of the People's Republic of China and other applicable jurisdictions worldwide.

NATIONS does not grant any license under its patents, copyrights, trademarks, or other intellectual property rights. Names and brands of third party may be mentioned or referred thereto (if any) for identification purposes only.

NATIONS reserves the right to make changes, corrections, enhancements, modifications, and improvements to this document at any time without notice. Please contact NATIONS and obtain the latest version of this document before placing orders.

Although NATIONS has attempted to provide accurate and reliable information, NATIONS assumes no responsibility for the accuracy and reliability of this document.

It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. In no event shall NATIONS be liable for any direct, incidental, special, exemplary, or consequential damages arising in any way out of the use of this document or the Product. NATIONS Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at user's risk. User shall indemnify NATIONS and hold NATIONS harmless from and against all claims, costs, damages, and other liabilities, arising from or related to any customer's Insecure Usage.

Any express or implied warranty with regard to this document or the Product, including, but not limited to, the warranties of merchantability, fitness for a particular purpose and non-infringement are disclaimed to the fullest extent permitted by law.

Unless otherwise explicitly permitted by NATIONS, anyone may not use, duplicate, modify, transcribe or otherwise distribute this document for any purposes, in whole or in part.
